

Parking lot USB exercise

Contents	Write 2-3 sentences about the types of information found on this device. • <i>Are there files that can contain PII?</i> • <i>Are there sensitive work files?</i> • <i>Is it safe to store personal files with work files?</i> The USB drive contains both personal and work files, including family photos and HR documents such as a new-hire letter and employee schedules. These files may include personally identifiable information (PII) and sensitive business data. Storing personal and work files together increases the risk of exposure if the device is lost or compromised.
Attacker mindset	Write 2-3 sentences about how this information could be used against Jorge or the hospital. • <i>Could the information be used against other employees?</i> • <i>Could the information be used against relatives?</i> • <i>Could the information provide access to the business?</i> An attacker could use the HR documents to impersonate employees or gain access to internal systems. Personal photos could be exploited for social-engineering attacks against Jorge or his colleagues. The mix of personal and professional data provides multiple entry points for phishing or identity theft targeting the hospital.
Risk analysis	Write 3 or 4 sentences describing technical, operational, or managerial controls that could mitigate these types of attacks: • <i>What types of malicious software could be hidden on these devices? What could have happened if the device were infected and discovered by another employee?</i> • <i>What sensitive information could a threat actor find on a device like this?</i> • <i>How might that information be used against an individual or an organization?</i> A malicious USB drive could contain malware that infects hospital computers when plugged in. This could lead to data breaches, ransomware, or unauthorized access to patient records. Technical controls such as disabling autorun, enforcing endpoint protection, and scanning removable media can mitigate these

	risks. Operational controls include employee training and policies separating personal and work devices. Managerial controls like encryption and access monitoring further reduce exposure.
